Protective potentials of the amino acid L-arginine against radiation-induced skin damage in rats. The present investigation was carried out to evaluate the radioprotective potentials of the amino acid L-arginine (Arg) against skin damage caused by gamma-irradiation. A total of 60 adult male Wistar rats were used in the study. Animals were divided into 4 groups. Group I (20 rats) was given L-Arg alone (200 mg/kg). Group II (20 rats) was given

Rational design of highly temperature-stable lactose-based star polymer and its nanocomposites. Highly temperature-stable star polymer (SP) was synthesized by grafting lactose onto poly(ethylene glycol)-b-poly(gamma-benzyl-lactobionamide) (PELBL) star polymer, which in turn is synthesized by living ring-opening polymerization of lactobionamide (LB) initiators. The change in the trans/cis ratio of the lactobionamide (LA) segments during the grafting reaction was monitored by ¹H NMR. The results show that the grafting reaction proceeded as a random process and that the ratio of LB segments in SP was in the range of 1.00-0.82. After the grafting, the
