Tired of using keyboard shortcuts to automate repetitive tasks, such as automatically merging pictures, copying a web page and more? KeyMacro lets you create and edit custom keyboard shortcuts that can be triggered by just a single keystroke. You can use KeyMacro to easily automate any process by creating an entry for each action that needs to be performed. KeyMacro is quick and easy to set up, and its presets can be used in any application to perform a specific task. Just start typing and KeyMacro can create

keyboard shortcuts to do the work for you, saving you precious time. KEYMACRO Features:

- Create and edit custom keyboard shortcuts
- Over 600 presets
- Remap keys
- Remote control

Use as keyboard shortcuts

What is this? DeadPixels are pixels on your screen that do not emit light. Where are they? It is common to find dead pixels on computer screens, because the alignment of the electron emitter layer with the phosphor layer is not always perfect. How do I identify dead pixels? These pixels are easily detected by looking at

the complete screen, and if more than one pixel is stuck, you should use a software. My software doesn't work, why? KeyMacro is a powerful automation software that allows you to create custom keyboard shortcuts and automate repetitive tasks. However, this product is designed to create keyboard shortcuts using Windows Media Player's built-in keyboard shortcuts. DeadPixels (also called Black Spots or Non-emitting Pixels) are pixels on the screen that do not emit light, so the ones that you see are the

pixels that are actually glowing. Open the file in CMD or in the IDE of your choice to edit the exe. Add the exe and its dependencies in the installer. Run the installer and let it install the exe. When the setup is finished, run the exe. I'm tired of spending all day at work looking at a computer screen trying to work out a problem. The screen has been flashing for a long time and I am getting really fed up of trying to press all the buttons on the screen but it's not working out. If there is a way to simply fix it, it would be great!Q:

DeadPix Portable is a lightweight application designed to identify and quickly fix dead pixels on your screen by switching through multiple colors. It has some easy-to-use options. Repair stuck pixels on your screen Although it's wrapped in a portable package, the tool has software dependencies. To be more specific, it cannot run unless you have .NET Framework installed. The utility is packed in a clean and intuitive interface made from one window that shows all

options put at your disposal.

There are two main components that make up DeadPix Portable: the pixel locator and the fixer.

Select the fullscreen color to spot dead pixels in contrast. When it comes to the pixel identification feature, you can choose the color that will cover the entire screen in order to spot the stuck pixels in contrast. The typical options include red, green, blue and black, but you can look for a custom color in the color spectrum provided by the app as well as opt for random mode to toggle multiple colors. In random

mode, you can also control the time interval between color switches. Once this step is complete, simply click "Start" to fill the entire screen with the selected color. Draw around the stuck pixel to start the fixer After spotting the dead pixels, you can return to the main window to adjust the duration of the pixel fixer, draw the region containing the stuck pixels, and put it in action. It should rapidly change colors until the issue is fixed. The developer recommends running this app for at least 10 minutes and cannot guarantee its

efficiency. Easy-to-use dead pixel locator and fixer The software program had minimal impact on the computer's performance in our tests, and we haven't come across any compatibility issues with Windows 10. All aspects considered, DeadPix Portable can be used by those interested in first resorting to software solutions in the attempt to fix dead pixels before considering changing their monitors due to this type of problem. 5.01
